CS536-S22, Intro to PLs and Compilers

2/27/2022

To invoke the program in the command line, you run “make” and then “make test.” There are four test files: allTokens.in, moreTokens.in, allErrors.in, and eof.txt which my program takes and creates output and diff files that showed the scanned value, the line number, and the char number. To add more input files, one would have to run “make clean” followed by “make cleantest” which just deletes the output and diff files.

Thanks,

Matthew
